

To Whom It May Concern:

I don't believe that toddlers should be tested on for smallpox. I myself believe that this not a must. I also believe that this is unethical. Would researchers want their children being tested on? I don't believe they'd actually give there two or five year old to be injected with a small vaccination of smallpox. Besides those forty children don't even amount to 1% of the U.S. population. That number isn't compatible. I also believe that the children might react harshly to the shots. For example if they get injected with the smallpox wouldn't have a negative outcome? The researchers don't even know what amount to inject them with. Did they ever think of what would happen if they give them the wrong amount? Some innocent child or children could possibly die. Also did they think what would be the chance of the vaccine mutating? As well as the children scratching, or touching the infected area. It could get on other parts of the body, or could get in other children's eyes, which could lead to blindness. Wouldn't this disease spread if it gets on other parts of the body? I just believe you'd be putting innocent children in tremendous danger. Besides they have a beautiful life ahead of them, so don't destroy it because of your new creations.

Sincerely yours,

Jessica I. London
